BACKGROUND: Over the last 30 years there has been interest in the use of autologous fat transplantation for breast reconstructive and cosmetic purposes. Up until now injection of adipose tissue into the breast has been subject to two limiting factors.

Autologous fat transplantation to the breast: a personal ...

An autologous fat transfer is a cosmetic procedure that involves the transfer of fat cells from one part inside the body to another part. Autologous is a term used in relation to cells, blood, and tissues that means to have been harvested and transplanted into the same individual.

What Is an Autologous Fat Transfer? (with pictures)

Autologous fat graft transplantation has become increasingly popular in recent years. The recognition that soft tissue volume loss contributes to the aging of the face has driven the use of this procedure. Tumescant liposaspirate provides ready accessibility of tissue for this transplantation, despite some perceived deficiencies in the predictability of volume maintenance with this method.

Autologous fat transfer in aesthetic facial recontouring

Autologous fat transplantation for soft tissue augmentation to reconstruct inborn or acquired tissue defects is an increasingly ideal method in the field of plastic surgery. However, the low survival rate and high reabsorption rate of the transplanted fat reduce the efficacy of this technique.

Improvement of the Survival of Human Autologous Fat ...

Autologous material: Because the fat is autologous (i.e. derived from your own body) there is no chance of rejection or allergic reaction to the material as there can be with other substances such as silicone or hyaluronic acid fillers.
