The design of concrete slabs and beams is not generally affected by fire design requirements. However, these can be a governing factor in the sizing of columns, particularly in multi-storey buildings. This article therefore concentrates on the guidance given in Eurocode 2 on the sizing of concrete columns for different fire resistance periods.

Concrete Design & Production Concrete is a mixture of two components: aggregates and paste. The paste, comprised of cement and water, binds the aggregates (usually sand and gravel or crushed stone) into a rocklike mass as the paste hardens.

About Design Concrete. Design concrete is a mixture of Portland cement, silica sand, polymer resins, with natural pigment added to provide colour. It is different to polished concrete, which is a traditional concrete that is merely polished. Design concrete, on the other hand, is applied in the same way as plaster and is only 2mm thick.

Steps to be followed in the design of slab Assuming suitable bearings (not less than 10cm), find the span of the slab between the centers of bearings. Assume the thickness of slab (take 4 cm per metre run of the span). Find the effective span which is lesser of (i) distance between centres of bearings, and (ii) clear span and effective depth.

This design concept is based on elastic theory, assuming a straight line stress distribution along the depth of the concrete. The actual loads or working loads acting on the structure are estimated and members are proportioned on the basis of certain allowable stresses in concrete and steel.

Concrete mix design is the procedure for finding the right quantities of these materials to achieve the desired strength. Accurate concrete mix design makes concrete construction economical. Large constructions such as Bridges, dams requires huge amount of concrete, using the right quantity of constituents make the structure economical.

The design was produced in Scotland by the Orlit Co, resulting in most houses being located in Scotland. On-site construction was based on a foundation which supported storey-high precast concrete columns at fixed intervals, supporting concrete beams fixed to the columns, resulting in a virtually monolithic frame.

A concrete mix is a combination of five major elements in various proportions: cement, water, coarse aggregates, fine aggregates (i.e. sand), and air. Additional elements such as pozzolanic materials and chemical admixtures can also be incorporated into the mix to give it certain desirable properties. While a concrete mix design is a process of selecting ingredients for a concrete mixture and deciding on their proportions.
