Introduction to Psychology for Medical Students deals with general psychology aimed for medical undergraduate students. The book discusses psychology and its relevance to medicine, particularly on the relation of the mind and the treatment of physical diseases. The authors explain perceiving and imagining; and how perception is dependent on past experience or learning, and the effects of motivation and of mood on perception. The authors also discuss abstract and concrete thinking, emotional use of words, unconscious thinking, creative thinking, learning, and remembering. The unconscious process of forgetting of unwelcome memories is repression, while consciously trying to forget them is suppression.
